

GoHealth – Data Testing

Summary

GoHealth requested a team for validating that displayed data on their portal mirrored the data which carriers sent them to advertise.

Project length: 2 months

Technology to test: web

Used tools: MS Excel, Jira

Keywords: Excel, web-testing, Jira

Solution

Introducing the candidates

SANAE supplied qualified applicants from its internal headcount in response to GoHealth's requirements. The chosen applicants were allocated to the project in the predetermined amount of time.

Working on the project

We provided dedicated test engineers in collaboration with GoHealth to provide its carriers our expertise in sw testing domain. Each of the eleven carriers the consumer used had tens of insurance plans that required verification. Our group examined the data that the carriers supplied us. Following analysis, the data transmitted by carriers and the data shown on two customer websites were compared. A collaborative testing environment was made possible by regular contact between GoHealth's testing team and developers, guaranteeing that the data appropriately mirrored the intended business logic. If any problems were found, our team reported them to the development team and recorded them in Jira, making sure they were resolved.

Benefits

The requested resource was delivered on time by SANAE Slovakia. Consistent reports gave the client useful information for well-informed decision-making, which improved the quality of the final product. The consultants gained a thorough understanding of the field.
